

Secure Access

Securing the hybrid workforce while protecting the organisation.

What is secure access?

Secure access is a key part of successful workforce transformations for both the employee and employer. For the employee, secure access solutions protect devices and secure connections to services, wherever they are. For the employer, secure access solutions ensure that no unauthorised users gain access to corporate apps, services or data, whoever they are. Secure access can be broken down into 3 core areas: endpoint security, secure access service edge (SASE) and zero trust.

Endpoint Security

Endpoint security protects user devices against cybersecurity threats, whether it's a desktop, laptop or mobile device. Modern solutions are more than traditional anti-virus solutions and leverage machine-learning to protect against more sophisticated malware and zero-day threats. Endpoint security detects, analyses, blocks, contains and responds to threats.

SASE

Secure access service edge (SASE) securely connects any user to any service, regardless of the user's location and whether the service is cloud or data centre based. SASE converges network and security capabilities into a single solution, simplifying policy controls for employers and delivering a seamless experience for employees. SASE capabilities include secure VPN connectivity, plus firewall and web gateway services.

Zero Trust

Zero trust treats all users and devices attempting to connect to local and remote networks as potential threats, requiring them to validate their identity and assigning them least-privilege rights before granting access. Employees are validated through multi-factor authentication (MFA) services, devices on local networks are validated through network identity services. Least-privilege access is granted using access controls on directory services and the services users are connecting to.

Technology and Services

Logicalis delivers secure access solutions using Cisco and Microsoft technologies.

Intelligent Connectivity is our prime secure access solution, built on top of Cisco SASE and zero trust technologies. This Logicalis managed service not only secures user access but delivers insight into performance, to continually drive improvements to user experience.

We also modernise existing endpoint security, SASE and zero trust solutions, with managed service options to simplify their operation and drive better experience.

A 2-hour workshop with your stakeholder and technical resources to discuss your business and technical requirements for implementing your flexible working strategy with Logicalis desktop-as-a-service.
